

Astha+ Multispeciality Hospital

Project Details & Functional Documentation

Interactive front-end prototype — a single-page web application demonstrating a complete hospital management experience across four role-based portals plus a public website.

Project	Astha+ Multispeciality Hospital
Type	Front-end prototype (HTML / CSS / JavaScript)
Prepared for	Project stakeholders / client review
Designed & developed by	Sangam InfoAnalytics, Junagadh, Gujarat
Website	https://www.sangaminfoanalytics.online/
Document date	29 September 2026
Status	Prototype / demo — placeholder data

1. Project Overview

Astha+ is an interactive prototype of a hospital management platform. It is delivered as a single web page that simulates a real product: a public marketing website where visitors can browse departments and doctors and book an appointment, and four separate role-based portals — Patient, Doctor, Admin, and Staff — each with its own dashboard and workflows.

The goal of the prototype is to let stakeholders **see, click and feel** the full workflow before any production development begins. Everything runs entirely in the browser; there is no server, database or login required, so it can be opened directly from a file or any static host.

Purpose & scope

- Demonstrate the end-to-end patient journey: discover → book → confirm → view in portal.
- Show how each hospital role (patient, doctor, admin, front-desk staff) uses the system day to day.
- Act as an approved visual and functional reference for building the production application.
- Provide a clickable demo that needs no installation — just open `index.html`.

Prototype note

This is a demonstration build. All names, doctors, reports and figures are placeholders. Data lives only in the current browser session and resets on a full page reload — there is no backend or persistent storage.

2. Technology Stack

Structure	HTML5 — a single <code>index.html</code> containing all views and screens
Styling	Custom CSS3 (<code>assets/css/styles.css</code>) — design tokens, responsive layout, animations
Logic	Vanilla JavaScript (<code>assets/js/app.js</code>) — no frameworks or build step
Icons	Inline SVG (crisp at any size, no icon library needed)
Fonts	Inter (with system-font fallback)
Dependencies	None — zero external libraries, fully self-contained
Hosting	Any static host or opened directly as a local file

3. File Structure

astha-hospital/	
<code>index.html</code>	All markup: public website + 4 portals, modals, footer
<code>assets/css/styles.css</code>	Complete stylesheet (design system, components, responsive)
<code>assets/js/app.js</code>	All interactivity: navigation, booking, portals, demo logic
Astha-Hospital-Project-Details.pdf	This document

4. How It Works

The whole application is a **single-page app** built by hand. The page is divided into five top-level "views": the public **Website** and the **Patient**, **Doctor**, **Admin** and **Staff** portals. Only one view is visible at a time.

View & screen switching

- The top navigation bar (Website / Patient / Doctor / Admin / Staff) calls `enterView()`, which shows the chosen view and hides the others.
- Inside each portal, the left sidebar menu switches between "screens" (Dashboard, Appointments, Records, etc.) by toggling a single on CSS class — no page reload.
- On-enter animations run automatically: number counters count up, bar charts grow, and donut charts draw themselves via `animateIn()`.

Data model (in-memory)

Content is generated from plain JavaScript arrays defined at the top of `app.js`, then rendered into the page:

DEPTS	8 departments (Cardiology, Orthopedics, Neurology, Pediatrics, Dermatology, ENT, General Medicine, Gynecology)
DOCS	One doctor per department, with speciality and initials
SLOTS	Available appointment time slots for scheduling
STAFF	Staff directory (doctors, nurses, technicians, support)
BEDS	24 in-patient beds with live status (available / occupied / cleaning / reserved)
waitTokens	Live token queue for the front-desk / OPD waiting area

No sign-in (demo mode)

Because this is a prototype, the login/registration gate has been removed. Clicking any portal in the top bar opens it directly with a built-in demo identity, so reviewers can explore every role instantly. "Sign out" simply returns to the public website.

5. Appointment Booking Flow

The core journey is a guided, 4-step booking wizard launched from the website (the "Book Appointment" button, a department card, or a doctor card):

Feature	What it does
1 Department	Choose the speciality (Cardiology, ENT, Gynecology, etc.).
2 Doctor	Pick the consultant for that department.
3 Schedule	Select a date (defaults to tomorrow) and an available time slot. Booked-out slots are disabled.

4 Details

Enter patient name, mobile, age, gender and an optional reason for the visit.

Confirmation & portal hand-off

- On **Confirm appointment**, a success screen shows a receipt: patient, doctor, department, date, time and an auto-generated reference number (e.g. APT-2606).
- The new appointment is **added live** to the Patient portal — it appears at the top of the "Upcoming" list on both the dashboard and the Appointments screen, and the upcoming-count stat increases.
- **View in portal** takes the user straight into the Patient portal's Appointments screen, where the booking they just made is visible, marked **Confirmed**.

6. Features by Portal

Public Website

Feature	What it does
Hero & home	Marketing landing page with call-to-action to book an appointment.
Departments grid	All 8 specialities; clicking a card starts booking for that department.
Doctors grid	Consultant cards with qualifications and a Book button.
Booking wizard	4-step guided appointment booking (see section 5).
Confirmation	Receipt screen with reference number and "View in portal".
Footer	Hospital info and a credit link to Sangam InfoAnalytics (opens the company website).

Patient Portal

Feature	What it does
Dashboard	Health summary: upcoming appointments, active prescriptions, quick stats.
Appointments	Upcoming and past visits; newly booked appointments appear here live.
Medical records	Consultations, diagnoses and discharge summaries.
Lab reports	Diagnostic and pathology results.
Prescriptions	Current and past medication plans.
Billing	Invoices, payments and insurance.
Profile	Personal and medical information.

Doctor Portal

Feature	What it does
Today's clinic	Dashboard of the day's appointments and on-duty status.
My patients	List of patients under the doctor's care; open a consultation.
Consultation	Tabbed workspace: diagnosis notes, prescription builder (add/remove medicines), lab orders.
Lab reports	Results awaiting the doctor's review.

Admin Console

Feature	What it does
Dashboard	Real-time operational overview with live charts and KPIs.
IPD & beds	Interactive bed board (24 beds); assign an awaiting patient to an available bed.
Appointments	Hospital-wide scheduling analytics.
Departments	Capacity and staffing across specialities.
Staff	Full staff directory; add or remove staff members via a modal.
Billing	Revenue, invoices and collections.

Staff Panel (Front Desk)

Feature	What it does
Front desk	Shift dashboard for reception.
Check-in	Today's scheduled patients; check them in and issue a token.
Register walk-in	Quick registration that creates a patient and issues a queue token.
Token queue	Live waiting-board; "Call next" advances the queue to the next patient.
Nursing station	Assigned inpatients, rounds, mark medication given and record vitals.

7. Interactive & Working Elements

Beyond navigation, these actions genuinely change the on-screen state during the demo:

- **Book an appointment** and watch it appear in the Patient portal.
- **Assign a bed** (Admin → IPD): select a patient, pick a green bed, confirm — the bed turns occupied.
- **Add / remove staff** (Admin → Staff) with a live-updating directory and counts.
- **Register a walk-in** and **Call next** to move the token queue (Staff).
- **Check in a patient** and issue a token (Staff → Check-in).
- **Build a prescription** in the doctor's consultation view.
- Toast notifications confirm each action, and charts/counters animate on every screen.

8. Design System

Primary (Blue)	#164A7B — headers, structure, trust
Accent (Green)	#35A56B — actions, success, highlights
Surfaces	#F5F8FA background, white cards, soft shadows
Status colours	Confirmed / Pending / Completed / Cancelled badges

Responsive	Adapts to desktop and mobile; sidebar collapses behind a menu button
Motion	Count-up numbers, growing bar charts, self-drawing donut charts, toasts

9. How to Run

- Open `index.html` in any modern browser (Chrome, Edge, Firefox), or
- Serve the folder with any static server (e.g. VS Code Live Server) and open the page.
- No install, build step, accounts or internet connection required.

Prototype limitations

- No backend, database or real authentication — data is in-memory only.
- Booked appointments and other changes reset on a full page reload.
- All patients, doctors, reports and figures are placeholders for demonstration.
- Intended as an approval and reference prototype, not a production system.
